Candidate 4 evidence

The times we live in are filled to the brim with formality. Schools, colleges and universities are not an exception at this point. Exams are thought to be the only proper way of evaluating students' knowleadge. I found it rather common but still fairly awkward truth that should be fought against.

Let me begin with the obviousness: the academic year lasts more less ten months. This is the time of intensive work, gaining knowledge and expierience which requires a significant involvement. Without any doubt it is a whole advanced proccess. With this is mind, the idea of assessing just one performance seems ridiculous. Not only can pupils be affected by stress and anxiety, but also have simply no luck for a particular, one-day task.

In addition, not every subject is suitable for being examined that way. Now and again, these are continuous assessments and practical projets that are able to reveal learning results. In order to discover the complexity of the world, a human child is equiped with five senses, a cheeky mind and nearly botomless imagination. Could they all be tested out by an exam?

Nevertheless, there is no coin with just one side. To balance the toss, overal fairness and usefulness of school assesments should be considered as well. I tend to think that exams are a kind of an uniform needed to follow one unique score pattern. The only way to decide if someone is tall or small is drawing a zero line. This is how objects become comparable and this is what any existing systems are biult on.

I am not going to beat about a bush: personally, I do not trust in exams. May I be biased, I am a geatest fan of learning for useful skills, everyday life and personal growth. May I be absurd, I have written this essay for my ESOL higher exam. Somewhere in between I strongly believe in natural, gradual development which does not ask for any exams score.
